Enhancing Bereavement Support in a Tertiary Cancer Centre: A Quality Improvement Study

Claire Cadwallader, Alison Coadley, Ann Griffiths, Amanda Watson, Julian Hampton-Matthews, Malcolm Cooper, Paula Horton. Clatterbridge Cancer Centre, CH63 4YJ, UK

10.1136/bmjspcare-2017-00133.82

Background Grief is a natural response to the loss of a loved one but can have the potential for long term adverse effects. Bereavement services are therefore essential to provide support and to identify those at risk of harm. A ‘day after death service’ for bereaved persons is a longstanding component of bereavement care at our tertiary cancer centre. Bereaved persons are met by a clinical nurse specialist the day after the death for a face to face discussion and support needs assessment. This system aims to improve support and identify those at risk of pathological grief reactions.

Aim Conduct a quality improvement project aimed at enhancing bereavement support at our centre by incorporating feedback from bereaved persons into trust-wide education and care quality indicators.

Methods A 12 month retrospective audit was undertaken to evaluate bereavement service outcomes. This was combined with feedback from stakeholders to develop a PDSA quality improvement cycle.

Results At baseline 51 deaths were recorded in 12 months. 42 people agreed to ongoing support following accessing the day after death service. 39 people did not require any further support following a single phone call. Three bereaved persons needed additional support due to prolonged/pathological grief, and were supported appropriately.

Stakeholder satisfaction surveys revealed an 88% approval rating for emotional support and practical help, and 100% would recommend the service to others. Qualitative constructive feedback suggested enhancing methods of detecting people at high risk of pathological grief and developing an action-oriented approach to bereavement support.

Conclusion Bereavement care incurs practical as well as emotional challenges. Despite positive feedback regarding the emotional support provided by our service, there are practical areas for development. The next step of our project is to incorporate these changes into education and information processing tools, before re-evaluating progress.

Subjective and Objective Chemosensory (Taste and Smell) Dysfunction in Treatment-Naive Cancer Patients

1Michelle Barrett, 2Pauline U Dubhir, 1Niamh O’Donoghue, 2Charles Gilham, 3Nasmi El Beltagi, 1,2Declan Walsh. 1Our Lady’s Hospice and Care Services, Dublin 6, Ireland; 2School of Nursing and Midwifery, Trinity College Dublin, Ireland; 3School of Nursing, Midwifery and Health Science, University College Dublin, Ireland; 4School of Medicine, Trinity College Dublin, Ireland; 5St Luke’s Radiation Oncology Network, St James Hospital, Dublin, Ireland; 6School of Medicine and Medical Science, University College Dublin, Ireland

10.1136/bmjspcare-2017-00133.83

Background Chemosensory dysfunction (CD); a defect in taste and/or smell) in cancer is associated with chemotherapy and radiotherapy or may occur as a result of cancer itself. CD can increase risk of weight loss and malnutrition as a result of food aversions and reduced dietary intake.

Aims
- To subjectively and objectively assess taste and smell in newly diagnosed non-head and neck cancer patients.
- To examine nutritional status in those with taste and smell changes.

Methods Consecutive pre-treatment cancer patients were recruited from radiation oncology clinics in a prospective observational study. A 12-item Taste and Smell Questionnaire evaluated the presence, severity and characteristics of taste and smell dysfunction and the Abridged Patient-Generated Subjective Global Assessment (abPG-SGA) measured nutritional status and symptoms. Burghart Taste Strips and ‘Sniffen’ Sticks Ofactory Test assessed taste and smell identification.

Results Twenty newly diagnosed (<3 months) patients were recruited. Diagnoses included breast cancer (9), gynaecological cancer (7) and colorectal cancer (4). Over half (n=12, 60%) reported subjective taste and/or smell changes or had abnormal objective tests. Of these, six reported taste and smell changes (TSC), two taste only and one smell only. Nine were identified as being at risk of malnutrition (abPG-SGA score ≥6). Four of them reported subjective taste or smell changes only while another two had both subjective and objective changes.

Conclusions Subjective and objective taste and smell testing were well tolerated. The majority of patients had subjective or objective TSC abnormalities before treatment. This is consistent with a previous study. Subjective assessment identified more TSC than objective. Those with TSC appeared to be at higher risk of malnutrition.

Thrombolysis for Pulmonary Embolism in Palliative Care: A Case Report

1Mike Macafatane, 2Louise Gilhooley, 3Eira Griffiths, 4Stephen Frost, 5Derek Willis. 1West Midlands Deanery, Telford, UK; 2Severn Hospice, Telford, UK; 3Shrewsbury and Telford Hospital NHS Trust, Telford, UK

10.1136/bmjspcare-2017-00133.84

Background Thrombolysis for pulmonary embolism (PE) in a patient with advanced cancer has never been reported in the literature. Whilst not an absolute contraindication, most clinicians would be wary of thrombolysing a patient with a limited life expectancy. A case is presented of a patient with advanced mesothelioma who received thrombolysis treatment with a resultant significant improvement in pleuritic chest pain and dyspnoea.

History The patient was a 69 year old man who was diagnosed with epithelioid mesothelioma and received radiotherapy to his right chest followed by palliative chemotherapy. Subsequent CT scanning showed disease progression and the patient declined further chemotherapy.

Thrombolysis The patient was admitted to hospital with sudden-onset shortness of breath and right sided chest discomfort which was felt to be due to disease progression. Three days later the patient developed new, severe left sided pleuritic chest pain and acute breathlessness. The patient was thrombolysed with alteplase (50 mg IV over 1 hour) on clinical suspicion of a PE. The pleuritic chest pain resolved completely and the acute severe dyspnoea improved significantly within two hours of treatment and a CTPA later confirmed acute-on-chronic pulmonary thromboembolism as well as progressive mesothelioma. The patient was transferred to the hospice four days later for ongoing management and end-of-life care.
Effect of Thrombolysis on Symptom Control

On admission to the hospice, the patient continued to complain of mild to moderate dyspnoea but had no pain. He was commenced on regular immediate-release morphine (10 mg QDS) for breathlessness but only required one breakthrough dose of analgesia before his condition deteriorated. The patient died comfortably nine days after thrombolysis treatment.

Conclusion Thrombolysis was very effective in controlling pleuritic chest pain and acute severe dyspnoea in this patient with PE and advanced cancer with a limited life expectancy.

P-86 DOES SOCIOECONOMIC STATUS AFFECT PLACE OF DEATH FOR PATIENTS KNOWN TO SPECIALIST PALLIATIVE CARE SERVICES?

1Mike Macfarlane, 2Emma Carduff. 1West Midlands Deanery, Telford, UK; 2Marie Curie Hospice, Glasgow, UK

10.1136/bmjspcare-2017-00133.85

Background Socioeconomic (SE) status can influence where patients die, although no previous studies have investigated whether this is true following referral to specialist palliative care (SPC) services. This study investigated whether SE group influenced place of death for patients known to SPC.

Methods Place of death and SE group (using postcode data from the Scottish Index of Multiple Deprivation - SIMD) were examined in 485 patients who had died and were known to SPC services within NHS Lothian. Records were excluded if patients had died in a care home or SIMD data were unavailable. A logistic regression model was fitted with place as a three level factor and SE group as a linear regressor. The significance of differences was tested by a likelihood ratio test and contrasts assessed with Wald tests.

Results Statistically significant variation (p=0.01) was found in hospital and hospice deaths between patients from the highest socioeconomic group and the lowest, although no variation was found in home deaths. Only 45% (22/49) of patients known to SPC services in the lowest SE group died in a hospice, compared to 60% (97/163) in the highest, while 28.5% (14/49) of patients known to SPC from the lowest SE group died in hospital compared to 12% (20/163) in the highest.

Conclusions Even after referral to SPC, statistically significant variation in place of death was found between patients from the highest socioeconomic group and the lowest. Patients from the highest SE group were more likely to die in a hospice and less likely to die in a hospital than patients from the lowest SE group, although no variation in home deaths was found. Further multivariate analysis and investigation of reasons for this variation are required.

P-88 EVALUATION OF A PILOT SERVICE DESIGNED TO IMPROVE TRANSITION FROM CHILDREN’S PALLIATIVE CARE SERVICES

Sinead Hutcheson, Clare White, Hilary Maguire. Northern Ireland Hospice, Belfast, UK

10.1136/bmjspcare-2017-00133.87

Background There are increasing numbers of young people (YP) with life limiting diagnoses living into adulthood. When these YP become too old for children’s hospice services there is a recognised gap in their care and they often experience challenges when transitioning into adult services. A two year pilot project was developed between a hospice’s adult and children’s services to try to address this gap and aid transitioning. The pilot involved a day service two Saturdays per month with occasional overnight trips, with two separate groups depending on the YP’s ability to communicate.

Aim To evaluate the pilot project.

Method Three focus groups made up of key stakeholders in the service (YP, their parents and staff) were performed and analysed using an adopted thematic analysis framework.

Results Three YP; seven parents and six staff members participated. Five main themes across the three groups were identified;

- Transition is Tough
- Continuity
- Parental Care
- The pilot service helps
- The Future
