Conclusion Patients are often referred very late in the terminal phase of their disease process. Whilst the specialist PAH team provide basic symptom control and support, earlier referral and proactive involvement of the HPCT as part of a multidisciplinary team would help address advanced care planning, complex symptom control and end of life care.

P-132 COMBINED ONCOLOGY & PALLIATIVE CARE CLINICS: WORKING IN PARALLEL

1Beccy Benham, 1Anna Broadbent, 1Amman Mader, 1Joanne Palmer, 1,2Carolyn Campbell, 1,2Rachel Newman, 1,2,3Jane Gibbins, 1Exeter Medical School, UK; 2Royal Cornwall Hospital Trust, UK; 3Cornwall Hospice Care, St Austell, UK

Background Early Specialist Palliative Care (SPC) introduced to patients with advanced lung cancer has recently been proven to enhance quality-of-life and improve survival.1 Combined Oncology and Palliative Care Clinics (COPCC) have been carried at Royal Cornwall Hospital Trust for over two decades, to enable patients to be reviewed by Palliative Care Consultants (PCC) whilst attending Oncology Outpatient review; enabling the two specialities to run in parallel to improve patient care. The aims of this project were to explore the types of patients seen and content of consultations.

Methods A retrospective review of the current PCC consultation letter of 150 consecutive patients reviewed between 01/2016-06/2016. Data collected by three medical students.

Results Of the 150 patients, 49% had on-going/plan palliative oncological options (POO), 20% optimal supportive/symptom control (SSC), 18% radical treatment and 13% treated with curative intent. 75% had stable disease, 23% deteriorating and 2% in their last month of life.

The main focus of the consultation was symptom control (95%), followed by discussions around aims of palliative/oncological treatment (71%).

For patients who were considered POO or SSC (n=104), 66% were referred/known to the community SPC nursing team. The median number of consultations per patient was 66% were referred/known to the community SPC nursing team. The median number of consultations per patient was 6 months prior to death. 11/18 patients died during their last hospice admission, and seven were discharged home.

Place of death: 29/150 (19%) patients died at the time of data collection; 12 (41%) died at home, 11 (38%) died in a hospice, 3 (10.5%) died in acute 3 (10.5%) or 3 (10.5%) community hospitals.

Conclusion Access to SPC in COPCCs appears to enable early contact with inpatient hospice units, and enable more patients to die in hospices and at home. 38% of this study’s deceased patients died in a hospice; a 2.3 fold increase compared to hospice deaths of cancer patients specifically (16.4%).

P-134 SHOULD SIM MAN DIE? FINAL YEAR MEDICAL STUDENTS’ BELIEFS AND ATTITUDES REGARDING DEATH IN SIMULATION

1Lowri Evans, 1Joseph Hartland, 1Swindon Academy, Great Western Hospital, Swindon, UK; 2University of Bristol

Background Learning to deal with death is an essential for medical graduates but there is no educational consensus whether sim man should die in undergraduate simulation. Concerns include being too distressing for students or
