<td>Lucey et al. 2008, Ireland</td>
<td>Specialist palliative home care, including community pharmacy, General Practice and specialist home care nursing.</td>
<td>A systems analysis to highlight factors causing delays in the process of obtaining medications for patients under the care of a specialist palliative home care provider.</td>
<td>1) Survey 111 GPs registered in North Dublin 57 Retail pharmacists registered in North Dublin 22 patients who were referred to one hospice home care team. 2) Observational cohort study (12 reports by nurses in specialist care team).</td>
<td>1) Perceived factors causing delay in medicine access process: <strong>GPs</strong>: need to clarify the advice given by the home care team (30.6%); the inability of someone to collect the prescription (23.4%); the patient being unable to attend the surgery (18.9%) <strong>Pharmacists</strong>: some specialist palliative care medications were not stocked (49.1%), difficulty in obtaining the supply of these types of medications (33%); medication not being available on the medical reimbursement system (GMS) (49%) <strong>Patient results</strong>: received their medication without delay (54%); had not been advised to change their medication by the home care team (46%) 2) Nurse reported 12 delays &gt; 24 hours over a 12 week period; 11 delays were &gt; 48 hours, and 6 delays were due to medication not being in stock. 86% of agencies reported HEMK often averted hospital or emergency department visits.</td>
</tr>
<tr>
<td>Bishop et al. 2009, USA</td>
<td>Hospice emergency medication kit (HEMK)</td>
<td>To survey all active hospice programs about their use of HEMKS.</td>
<td>22 Clinical nurse directors or nurse managers in one state.</td>
<td>1) 14 of 21 hospices reported using HEM. Perceived value of HEMK were preventing emergency department visits (69%), unscheduled nursing visits (54%) and pharmacy deliveries (77%) as well as increased satisfaction of both patients and nurses (both 100%). 2) Estimated time to symptom relief was shorter in Hospice A (with kits) patients than in Hospice B; Hospice A =56% received symptom relief within 30 minutes but Hospice B: none were satisfactorily treated in the same duration.</td>
</tr>
<tr>
<td>Walker and McPherson 2010, USA</td>
<td>Hospice emergency medication kit (HEMK)</td>
<td>To compare perceptions of hospice managers and clinicians regarding the value of Emergency Medication Kit (HEMK) and to assess outcomes.</td>
<td>1) 21 Clinical directors (or equivalent) at hospices in one state 2) Hospice A (with HEMK) = 154 patients Hospice B (without HEMK) = 103 patients.</td>
<td></td>
</tr>
</tbody>
</table>
After-hours nurses perceived caller satisfaction was significantly higher in Hospice A patients with a HEMK compared to both Hospice B and Hospice A patients without a HEMK.

77% of community pharmacies had a narcotics retailer license, 50% received prescriptions for and prepared narcotics each month. Half of the pharmacists reported that they did not counsel patients, primarily because they lacked information about the patient. Pharmacists reported communicating with terminally ill cancer patients was extremely difficult. 76% of community pharmacists felt it was important to be able to return opioids to wholesalers to make opioids more easily available to patients.
### Bennie et al. 2013

**Community pharmacy**

To investigate how older palliative care patients and their carers access information about their medication and what knowledge they have of community pharmacy services

**Qualitative**
- Focus group interviews

14 patients (aged 65–79)
13 carers (aged 57–74) took part in six separate focus groups.

1) Access to medication information
- Patient information leaflets appeared to be most common source of information about drugs
- Participants preferred face-to-face interactions when possible

2) Study participants had limited knowledge of available help for them from their community pharmacist regarding their medications; a more proactive role of community pharmacists in disseminating relevant and tailored information to older palliative care patients was desired.

### Leigh et al. 2013

**Hospice emergency medication kits (HEMK)**

To evaluate Hospice Emergency Kit (HEK), medication utilization, safety, diversion and perceived impact

**Quantitative**
- Chart abstraction and questionnaire survey

76 deceased veterans discharged to home hospice
78 hospice nurses in 16 community hospice agencies (49% response rate)

59% of the nurses felt HEMKs were helpful 100% of the time (mean 84.2%) and 93% felt an emergency visit or hospitalization was avoided by having the kit in the home.

### Miller 2017

**Community pharmacy**

To investigate the delivery of palliative care services by community pharmacists in Sheffield

**Mixed-methods**
- Prescription analysis;
customer survey;
health care professional interviews

1) 5 community pharmacies
2) 75 prescription data collection forms
3) 55 customers
4) Pharmacists: 6
   A) Community pharmacists who participated in Phase 1 = 5
   B) Working in intermediate care = 1
5) Doctors: 4

1) Stock availability led to delays: approximately 1 in 5 customers had to go to more than one pharmacy to get urgently required palliative care medication, with one in two customers who were referred by a healthcare professional needing to go to more than one pharmacy.
2) No evidence that errors on prescriptions led to a delay in obtaining palliative medication.
3) The median time taken for accessing urgent palliative care medicines was significantly longer for non-commissioned service pharmacies (5 hours) compared to pharmacies commissioned to hold stock of palliative...
